# **WHEAT PERFORMANCE IN ILLINOIS TRIALS - 2007**

## **Crop Sciences Special Report 2007-01, July 2007**

**Emerson D. Nafziger, Darin K. Joos, Ralph W. Esgar, and Brian R. Henry**  
**Department of Crop Sciences, University of Illinois, Urbana**

Following record wheat yields and good doublecrop soybean yields in 2006, wheat acreage increased moderately in Illinois for 2007, with 970,000 acres planted in the fall of 2006. The fall was relatively cool and wet in many areas, and the crop got off to a rocky start.

December and January were relatively mild, and crop caught up some on growth, before very cold February weather set in. The cold caused winter injury to some varieties at the northern locations. March was much warmer than normal, and growth of the crop was excellent by early April, with height and growth stage both ahead of normal. On April 5-10, however, an unusually widespread and severe cold spell settled over Illinois, with temperatures in the upper teens to low 20s over the entire state on April 7 and 8. Leaf damage was extensive, and damage to the lower stems was common throughout Southern Illinois, where the wheat had jointed. Damage to main stalk heads also occurred, especially in fields that had been planted early. Some producers, especially south of I-64 (Mt. Vernon) destroyed the crop, as did some producers in the northern half of Illinois, especially where stands and growth had not been very good before the freeze. The variety trial at Dixon Springs, which had not emerged well, was abandoned.

After the freeze, the weather in April and May was outstanding for wheat in most areas, with below-normal rainfall and warm temperatures. The excellent weather encouraged growth of secondary tillers, which in some fields supported nearly all of the heads that formed. A substantial amount of barley yellow dwarf virus (BYDV) appeared in some fields, probably carried by aphids in March, before the freeze. Heading time ranged from later than normal in much of southern Illinois (where tillers had to grow back) to about normal in the northern part of the state. The warm weather fostered very rapid grainfill, and harvest started earlier than normal.

The freeze resulted in the greatest amount of abandonment in recent years, with harvested acreage estimated at only 810,000 (83%) of the 970,000 acres planted. Yield on acres harvested this year is estimated at 57 bushels per acre, which is the third-lowest yield of—and 2 bu less than the average of—the past 10 years. Test weights were good, and the quality of the crop was generally good, though there was some Fusarium head scab in fields in southwestern Illinois. Seed treatment insecticide (Gaucho), which provides some protection against the aphids that transmit BYDV, produced a yield increase in three or four selected varieties at most locations.

Plots in these trials were seeded at the rate of 36 seeds per square foot, and consisted of six, 7.5-inch rows trimmed to about 17 feet long before harvest. There were three replications. Yields were corrected to 13.5% moisture. The final table of the report includes Fusarium head scab ratings from Dr. Fred Kolb's misted, inoculated scab trial at Urbana. Seed companies were allowed to include entries treated with seed-applied insecticide (Gaucho or Cruiser), with the insecticide identified in the name. We treated seed of four varieties with Gaucho at each location as a test of yield response to this input.

<b><u>Location</u></b>	<b><u>Cooperators</u></b>	<b><u>Soil type</u></b>	<b><u>Planted</u></b>	<b><u>N fertilizer</u></b>	<b><u>Harvest</u></b>
Dixon Springs	Steve Ebelhar Ron Hines	Grantsburg silt loam	Oct. 12	25 Fall 95 Spring	Abandoned
Belleville	Ron Krausz	Ebbert silt loam	Oct. 12	30 Fall 80 Spring	June 20
Brownstown	Lindell Deal	Cisne silt loam	Oct. 9	30 Fall 70 Spring	June 15
Orr Center	Mike Vose	Clarksdale silt loam	Oct. 3	40 Fall 60 Spring	June 20
Urbana	Bob Dunker Mike Kleiss	Flanagan silt loam	Sept. 28	40 Fall 40 Spring	June 21
DeKalb	Lyle Paul Dave Lindgren	Drummer silty clay loam	Sept. 21	40 Fall 40 Spring	July 2

Participating companies are listed on Page 2, regional averages on Pages 3 and 4, individual site results in Pages 5-10 (data from 2006 at Dixon Springs are repeated here, since the 2007 trial was abandoned), wheat variety characteristics on Page 11, and the Fusarium head scab ratings on Page 12.

## **Participating Companies**

We thank these companies for their support of this program in 2007.

Averaged over four varieties in this location, Gaucho seed treated decreased yield by 3.4 bushels/acre.

\*Low yields of these varieties were partly related to winter injury.

**Table 9. Agronomic characteristics of wheat varieties sold in Illinois. Descriptions of private varieties are provided by companies. See the bottom of the table (second page) for codes.**

**Codes:**

Type: V = variety; B = blend; H = hybrid

Maturity: E = 2 or more days earlier than average; ME = 1-2 days early; M = medium maturity, or about average of most varieties grown in Illinois; ML = 1-2 days later than M; L = 2 or more days later than M

Head type: S = smooth (not bearded); T = tip-awned; B = awned (bearded)

Winterhardiness and standability are rated fair (F), good (G), very good (VG) or excellent (E)

Plant height: S = short; M = medium; T = tall

Hessian fly and disease reactions: S = susceptible; R = resistant; I = intermediate;

MS = moderately susceptible; MR = Moderately resistant

Table 10. 2006 - 2007 Fusarium Head Scab evaluation of variety trial entries at Urbana.

Varieties with greater head scab resistance have lower rating or index numbers. Some varieties winterkilled in 2007.

Data are from Dr. Fred Kolb's wheat breeding program, and include some of the varieties entered into the wheat variety trial.

The test nursery was inoculated and mist irrigated. DON (2006 only) is amount of the vomitoxin DON (low is good).

Incidence = the percent of heads in a row with symptoms. Severity = the percent of spikelets in a head with symptoms.

Kernel rating = the percent of shriveled seed. FHB Index = incidence x severity/100.

Low ratings or index numbers mean higher resistance. ISK Index combines incidence, severity, and the % shriveled seed.
