WHEAT PERFORMANCE IN ILLINOIS TRIALS - 2011

Crop Sciences Special Report 2011-01, July 2011

Emerson D. Nafziger, Darin K. Joos, Ralph W. Esgar, and Brian R. Henry
Department of Crop Sciences, University of Illinois, Urbana

The 2011 wheat season in Illinois was much better than the 2010 season, with good (but not record) yields and very good grain quality. Planted acres rebounded nicely in 2011, going from 330,000 acres in 2010 to 760,000 acres in 2011. Yields in 2011 were higher than those in 2010 in every crop reporting district except the southeast, and ranged from 76 bushels in the northeast to 50 bushels in the southeast. The preliminary state yield estimate for 2011 is 61 bushels per acre, up from only 56 bushels in 2010. The 2011 yield is about 1.5 bushels more than the average of the previous decade, and has been exceeded in Illinois only three times; the highest state yield to date is 67 bushels, in 2006.

The dry fall in 2010 allowed early harvest of the summer crops and the wheat crop to be planted on time, but soils were dry enough to slow emergence in some areas, resulting in late and uneven emergence in some fields. The winter was favorable for keeping wheat alive, with very few periods of warm weather that made the crop break dormancy before returning to cold. Greenup and early growth in the spring were typical, but wet and cool weather beginning in April and lasting into May provided less than excellent growing conditions. May weather warmed eventually, and heading/flowering occurred close to its normal time. Rainfall was abundant in May, but fortunately there was a period of dry weather when much of the crop was flowering, and Fusarium head scab did not develop to become a large problem in most areas in 2011. The weather turned hot in early June, and harvest was delayed some by rainfall in mid-June. Test weights were generally high, and doublecrop soybeans generally got off to a good start.

The 2011 wheat variety trials were planted on time, under reasonably good planting conditions. Dry soils affected the crop to some extent, and tillering was not as extensive by spring 2011 as would have been ideal. Heavy rain and storms before harvest knocked some grain out of the heads at Brownstown and at the Orr Center, and reduced yield at both locations, perhaps more in early compared to later varieties. But all data were usable, and yields were good at all locations.

Plots in these trials were seeded at the rate of 36 seeds per square foot, and consisted of six, 7.5-inch rows trimmed to about 17 feet long before harvest. There were three replications. Yields were corrected to 13.5% moisture. The final table of the report includes Fusarium head scab ratings from Dr. Fred Kolb's misted, inoculated scab trial at Urbana. Seed companies were allowed to include entries treated with seed-applied insecticide, with the insecticide treatment identified by product name. We also entered both treated and untreated seed of several varieties at each location as a test of yield response to this input. Averages from those comparisons were used to generate the statement at the bottom of each table.

| <u>Location</u> | <u>Cooperators</u> | <u>Soil type</u> | <u>Planted</u> | <u>N fertilizer</u> | <u>Harvest</u> |
|------------------------|---------------------------------|----------------------------|-----------------------|----------------------------|-----------------------|
| Dixon Springs | Steve Ebelhar Carl Hart, Jr. | Grantsburg silt loam | Oct. 12 | 30 Fall 120 Spring | June 16 |
| Belleville | Ron Krausz | Ebbert silt loam | Oct. 12 | 30 Fall 85 Spring | June 24 |
| Brownstown | Lindell Deal | Cisne silt loam | Oct. 5 | 30 Fall 90 Spring | June 24 |
| Orr Center | Mike Vose | Clarksdale silt loam | Oct. 3 | 45 Fall 80 Spring | June 29 |
| Urbana | Bob Dunker Mike Kleiss | Flanagan silt loam | Oct. 1 | 40 Fall 40 Spring | June 28 |
| DeKalb | Lyle Paul Dave Lindgren | Drummer silty clay loam | Sept. 27 | 30 Fall 40 Spring | July 14 |

Participating companies are listed on Page 2, regional data in Tables 1 and 2, individual location data in Tables 3 to 8, wheat variety characteristics in Table 9, and the Fusarium head scab ratings in Table 10.

Participating Companies

We thank these companies for their support of this program in 2011.

Codes:

Type: V = variety; B = blend; H = hybrid

Maturity: E = 2 or more days earlier than average; ME = 1-2 days early; M = medium maturity, or about average of most varieties grown in Illinois; ML = 1-2 days later than M; L = 2 or more days later than M

Head type: S = smooth (not bearded); T = tip-awned; B = awned (bearded)

Winterhardiness and standability are rated fair (F), good (G), very good (VG) or excellent (E)

Plant height: S = short; M = medium; T = tall

Hessian fly and disease reactions: S = susceptible; R = resistant; I = intermediate;

MS = moderately susceptible; MR = Moderately resistant

Table 10. 2011 Fusarium head scab evaluation of variety test entries at Urbana, Illinois.
Head Scab Resistance Rating scale: 1 = resistant, 9 = susceptible.
